

Fewer than two stop events in three run on time

STIB network, 1 July to 26 August 2026, 9:15 to 13:45. On time: between 1 minute early and 3 minutes late.

On-time rate

64.64%

of scheduled stop events

Stop events

3.43M

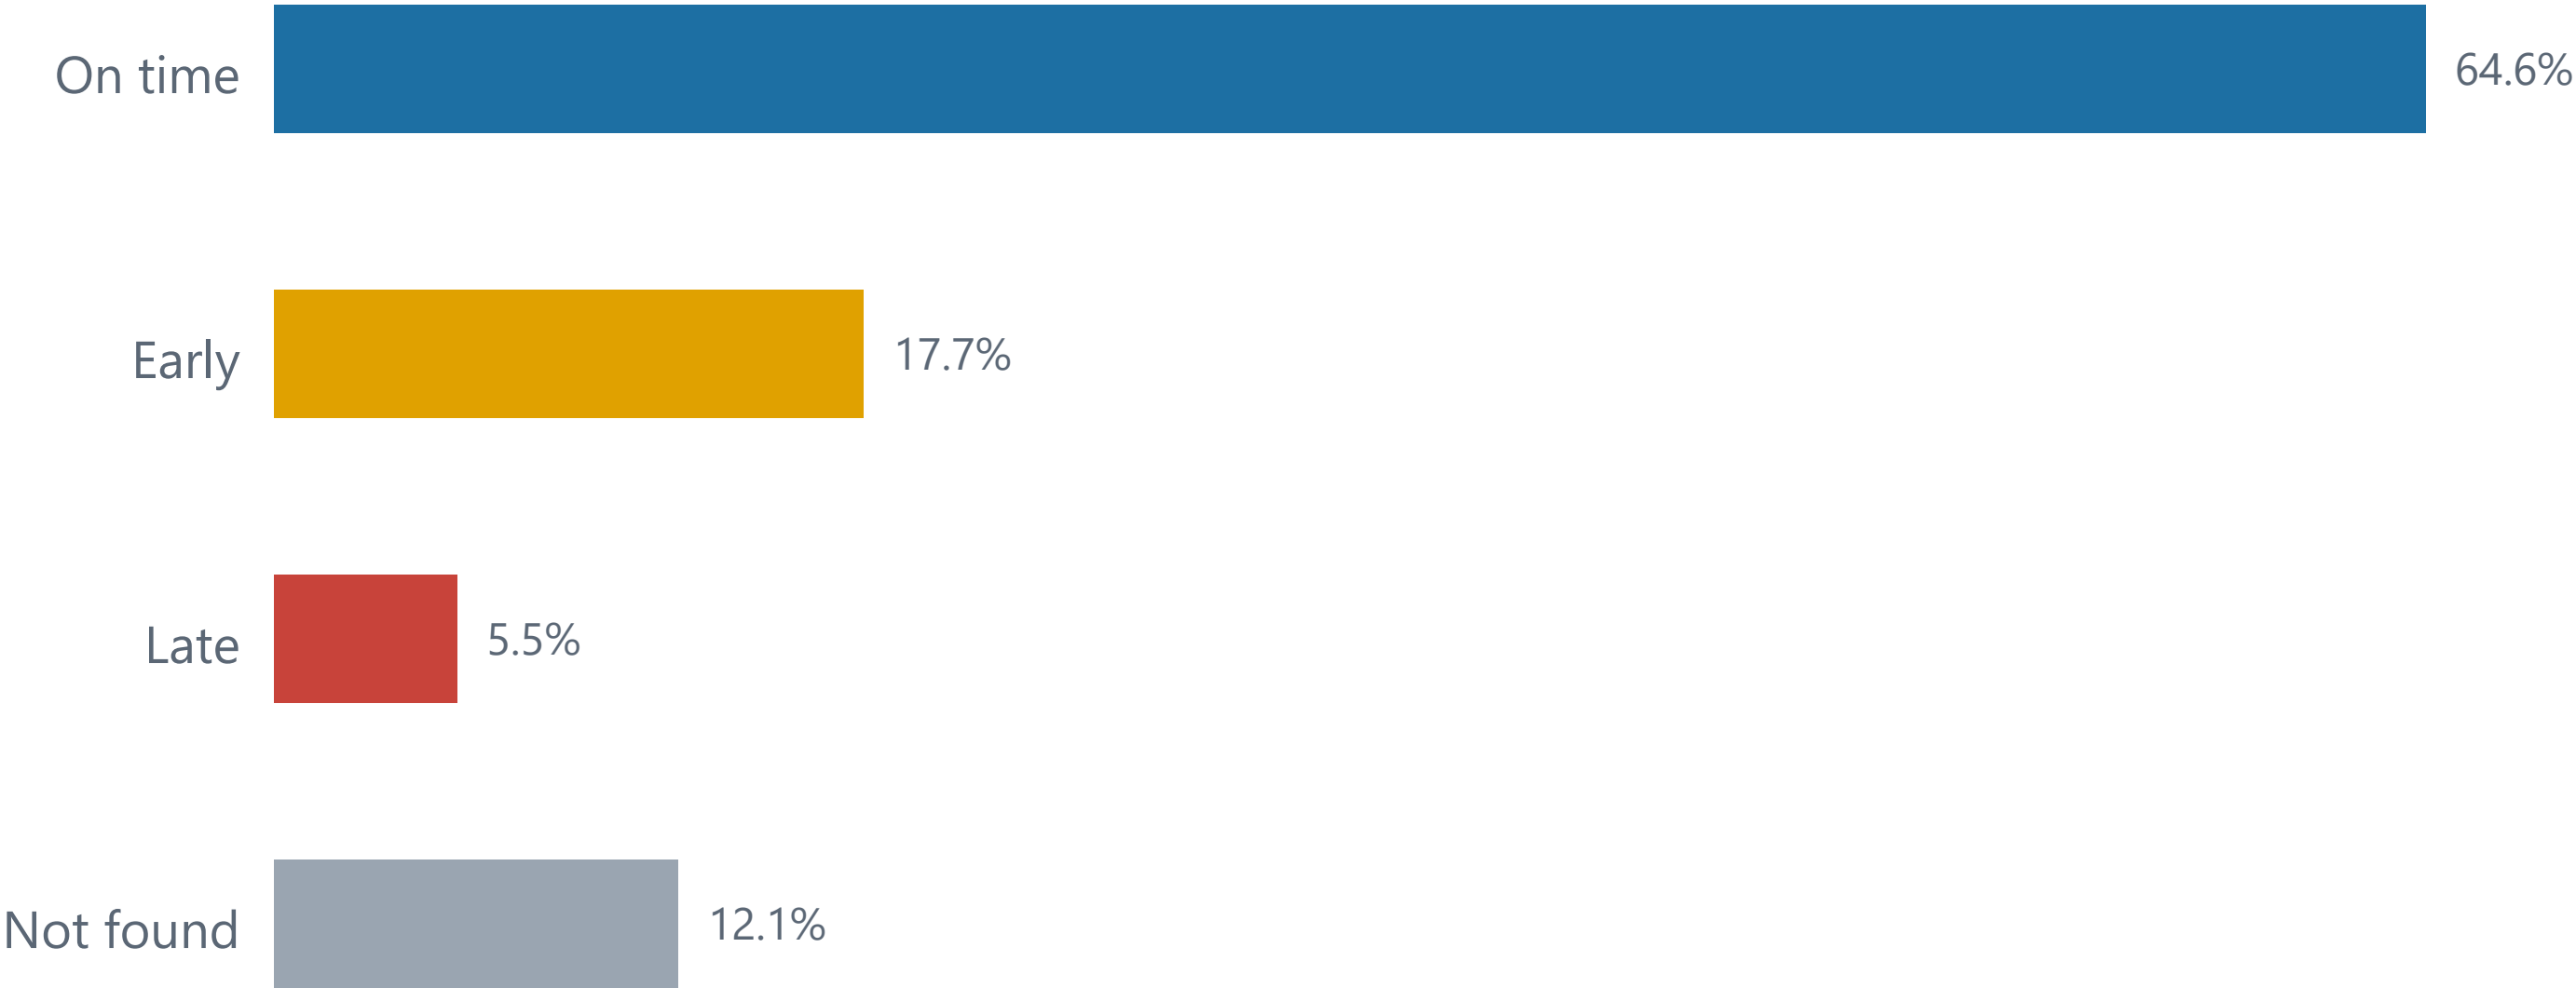

Lines

75

Days

52

Early running is the main cause of non-compliance

Mode matters, but not alone

Metro 87%, tram 69%, bus 59%. Yet bus line 78 does better than two metro lines.

Lines →

Poorly calibrated running times

One segment in three is run at least 10 s faster than scheduled, one in five at least 10 s slower.

Zoom →

Few problem stops, but clear ones

Out of 852 stops measured, 54 are more than 10 points below their lines. Interchange hubs are not among them.

Stops →

Large day-to-day variation

The on-time rate ranges from 57% to 68% depending on the day, especially on the metro. Day of the week and time of morning explain almost nothing.

Time →

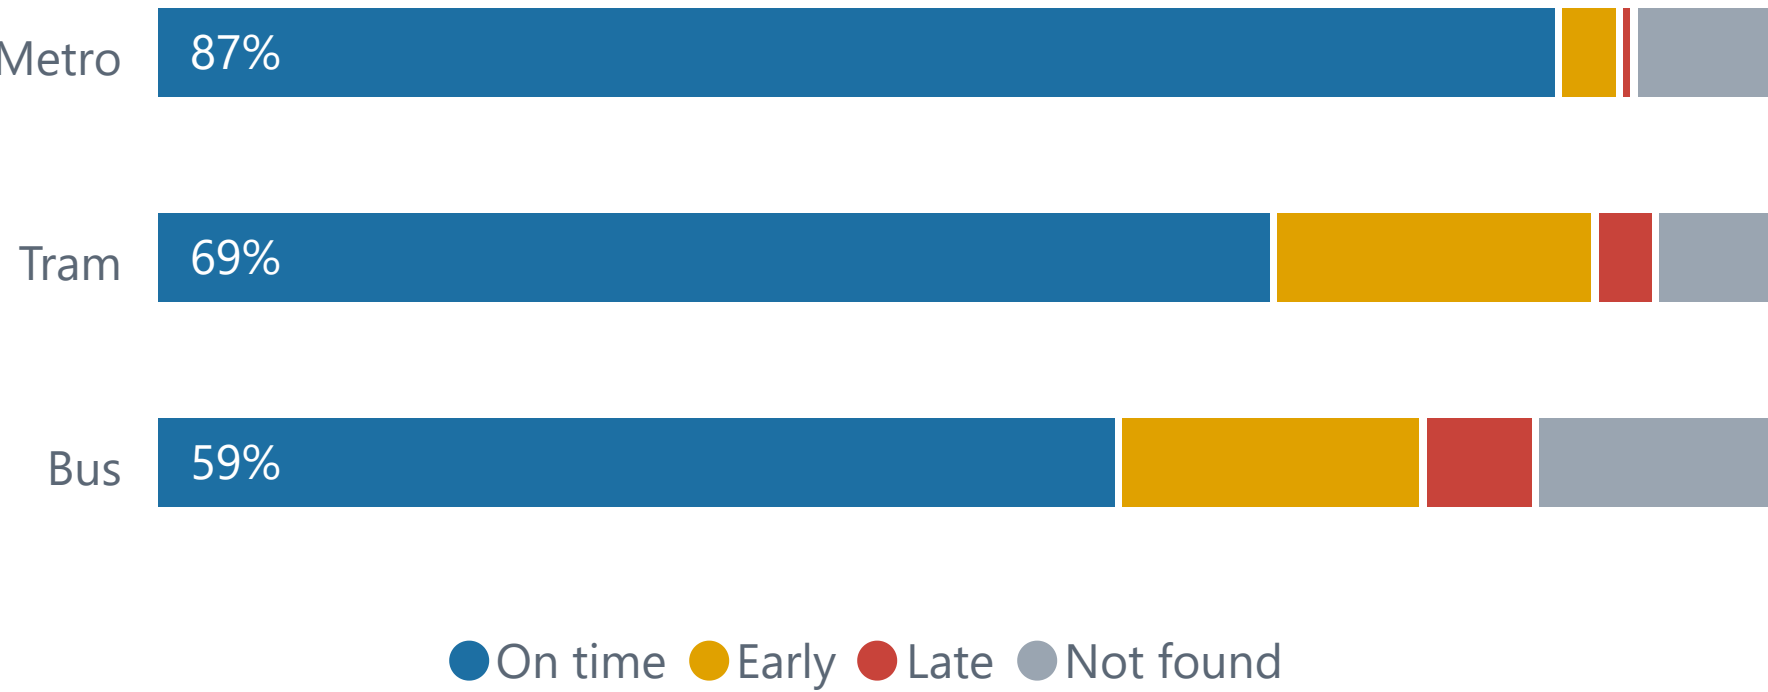

Method and limitations →

Explore the data →

Comparison based on the on-time rate, 71 lines ranked; 4 excluded (M1, M5, T7, 35): no service at the start or end of the period.

Metro	Tram	Bus
-------	------	-----

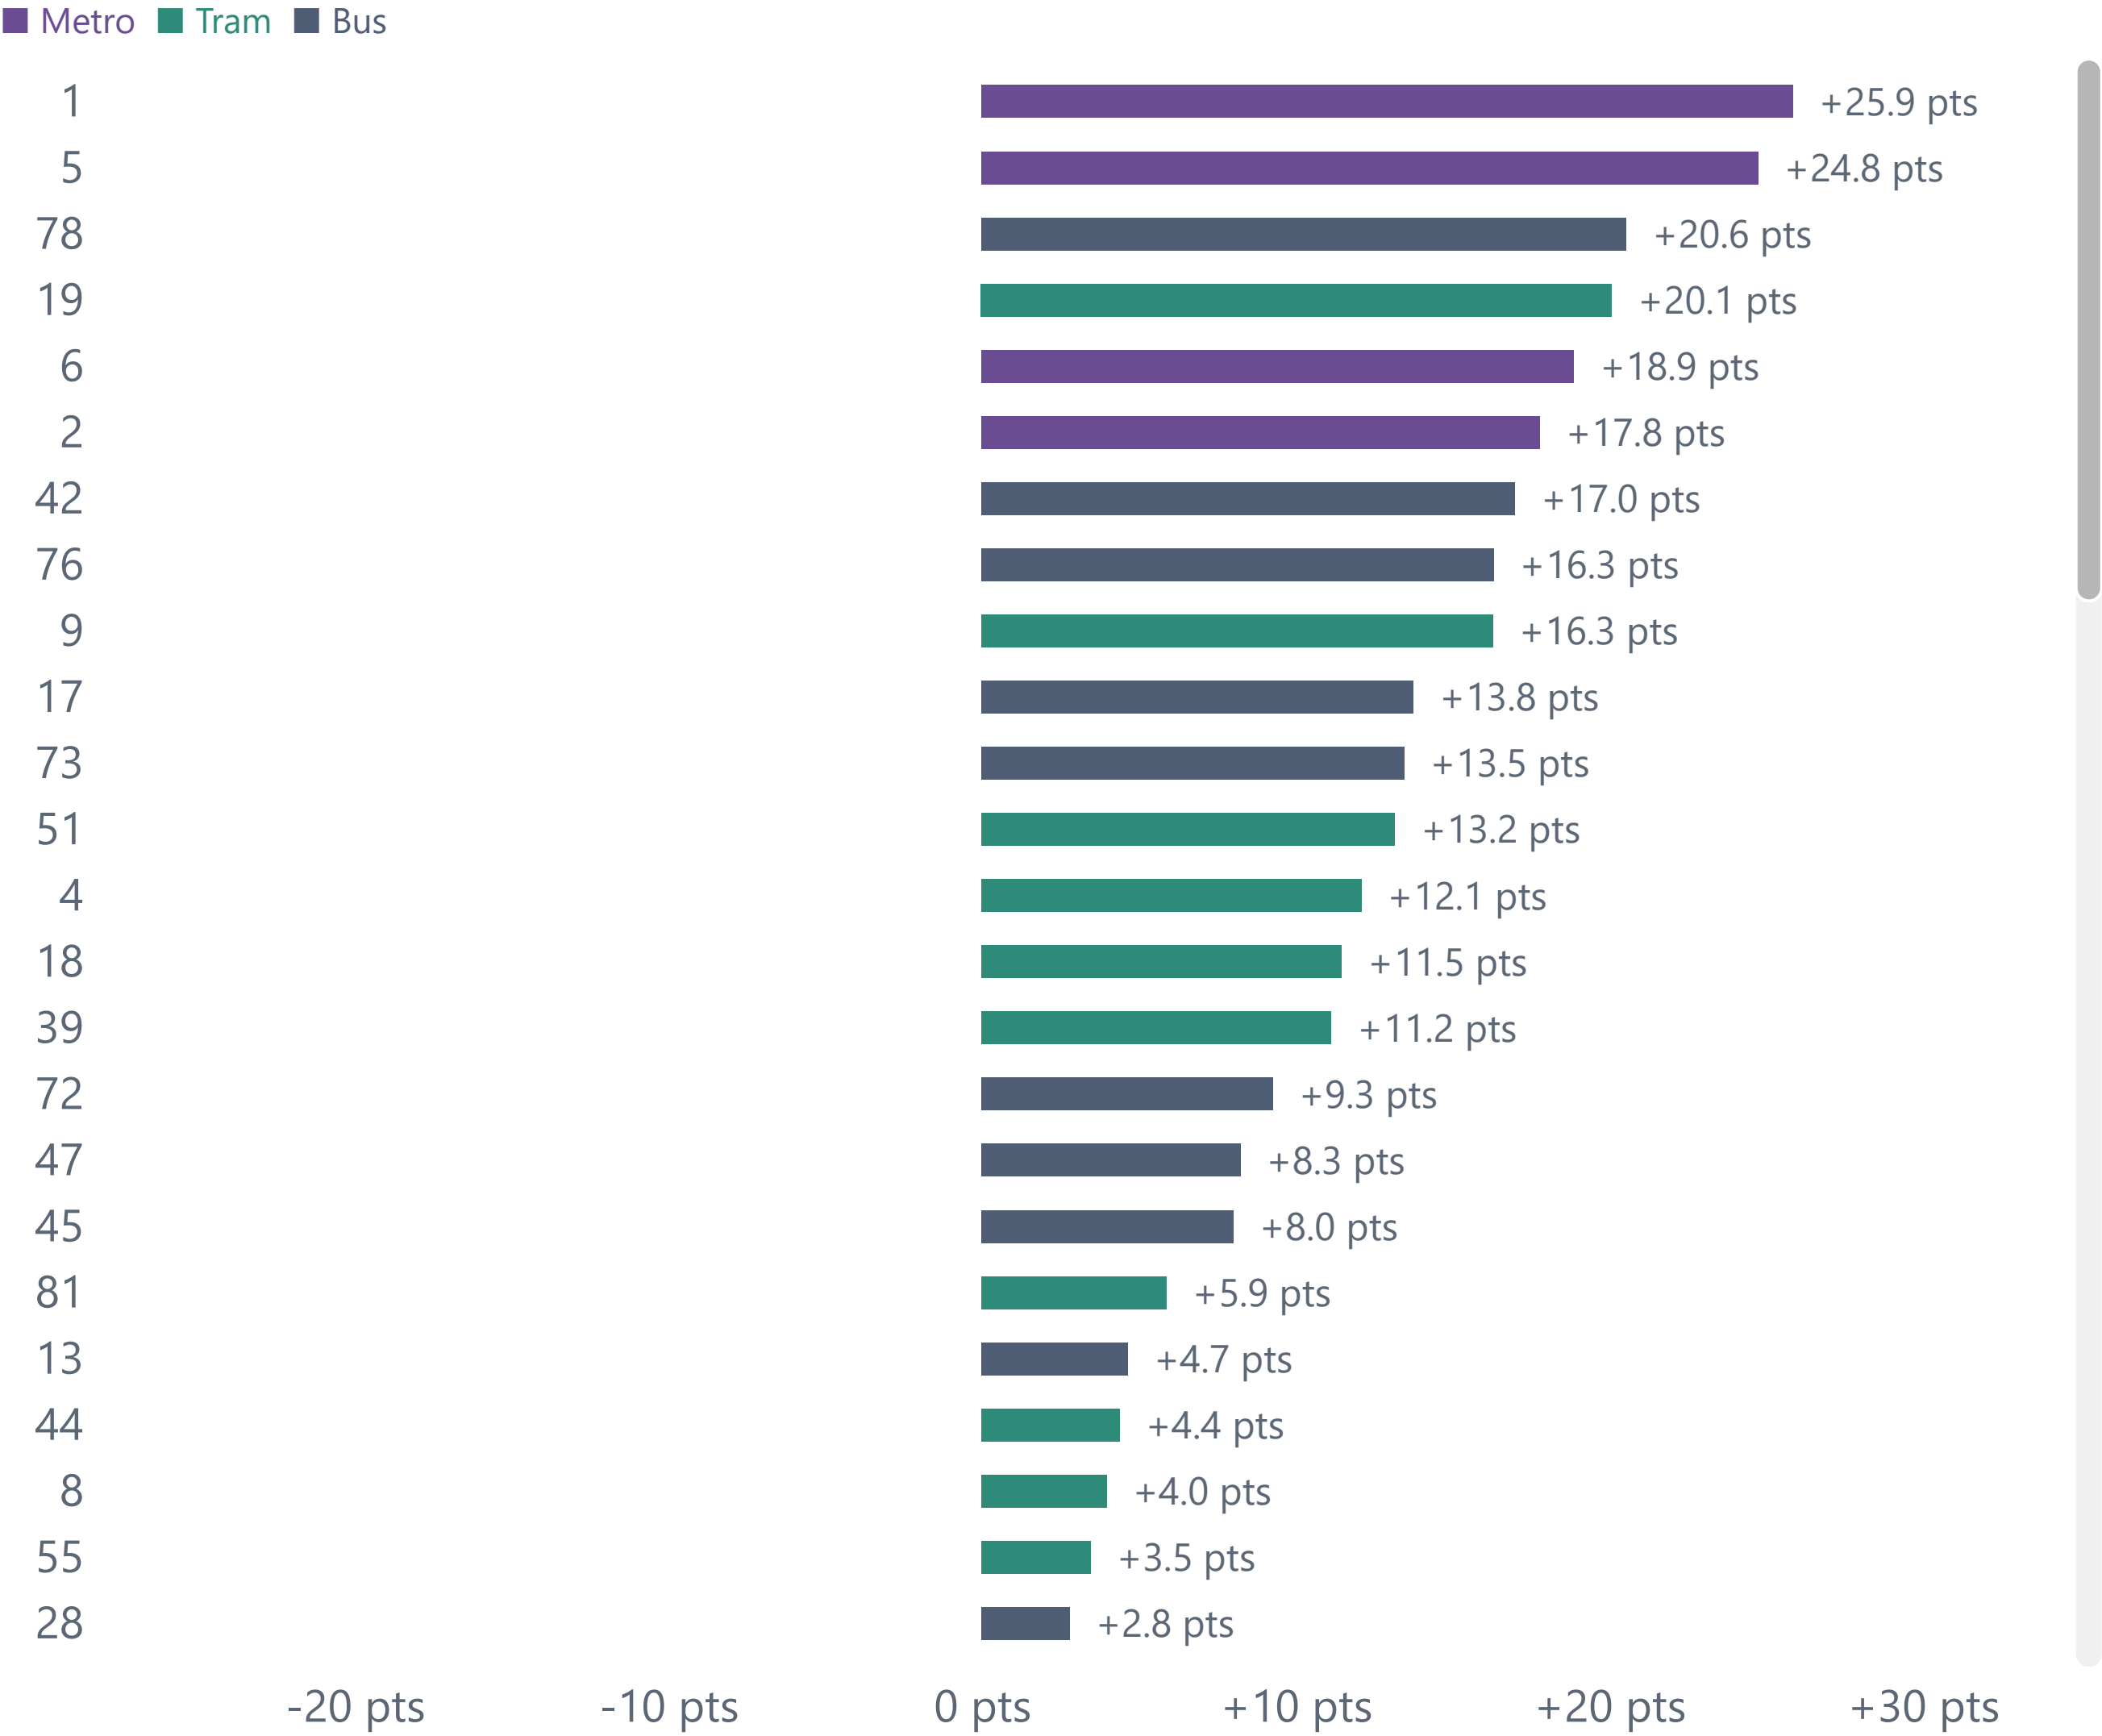

The metro is on time almost 9 times in 10, the bus 6 times in 10

Key takeaways

Tram and bus lose mostly to early running (19.9% and 18.9%), far more than to late running.
Bus line 78 (85.2%) does better than metro lines 2 and 6.
The four least punctual lines are buses (37, 20, 96, 65), all at least 19 points below average.

Gap of each line to the network average (64.6%)

→

Most stops behave like their lines

54 of the 852 stops evaluated are more than 10 points below their lines.

Punctuality varies by more than 10 points from one day to the next, especially on the metro

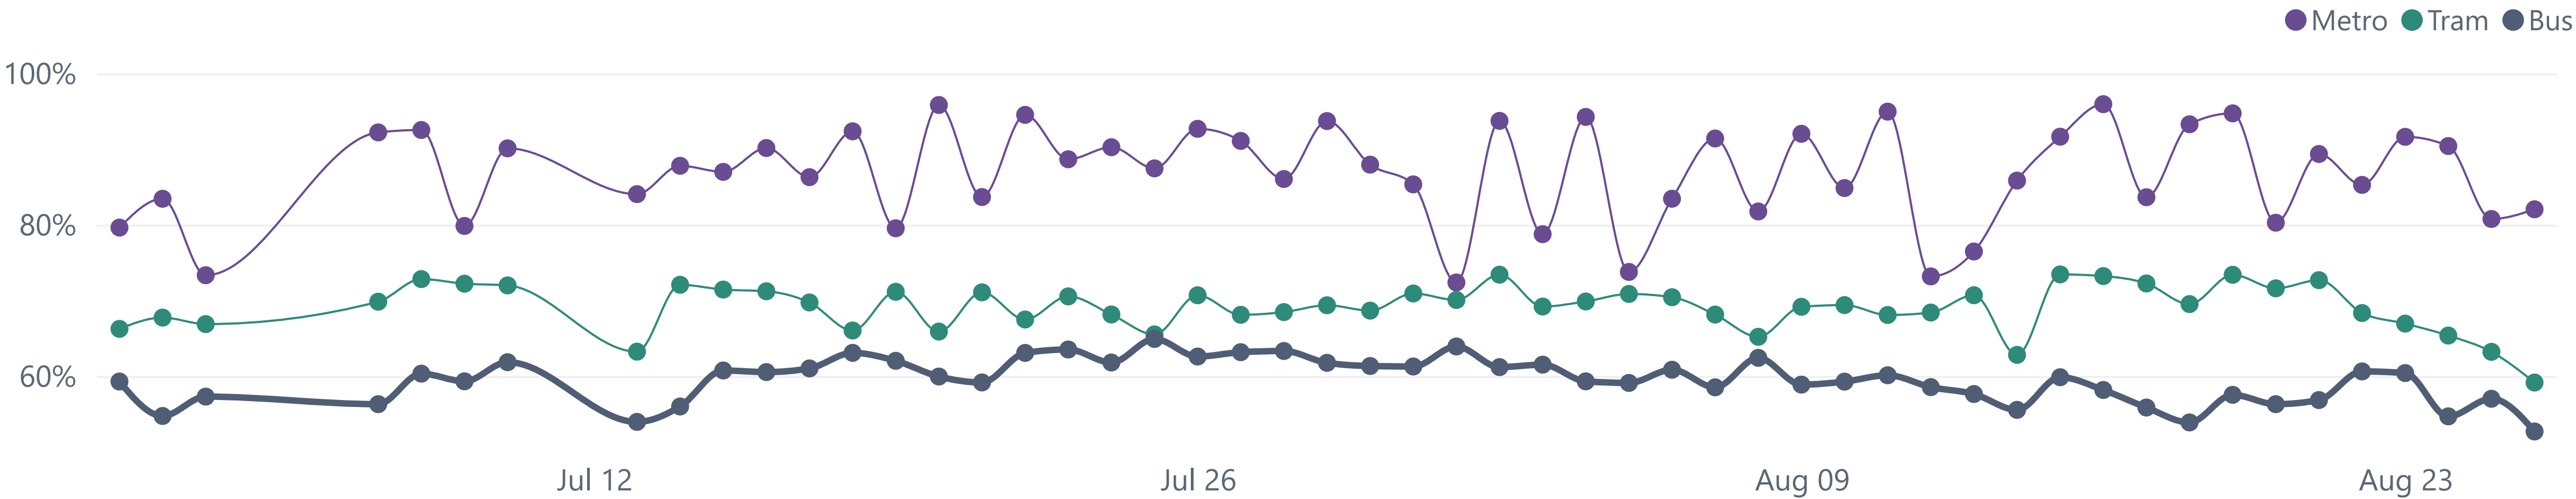

Day of the week and time of morning barely explain it

Metro

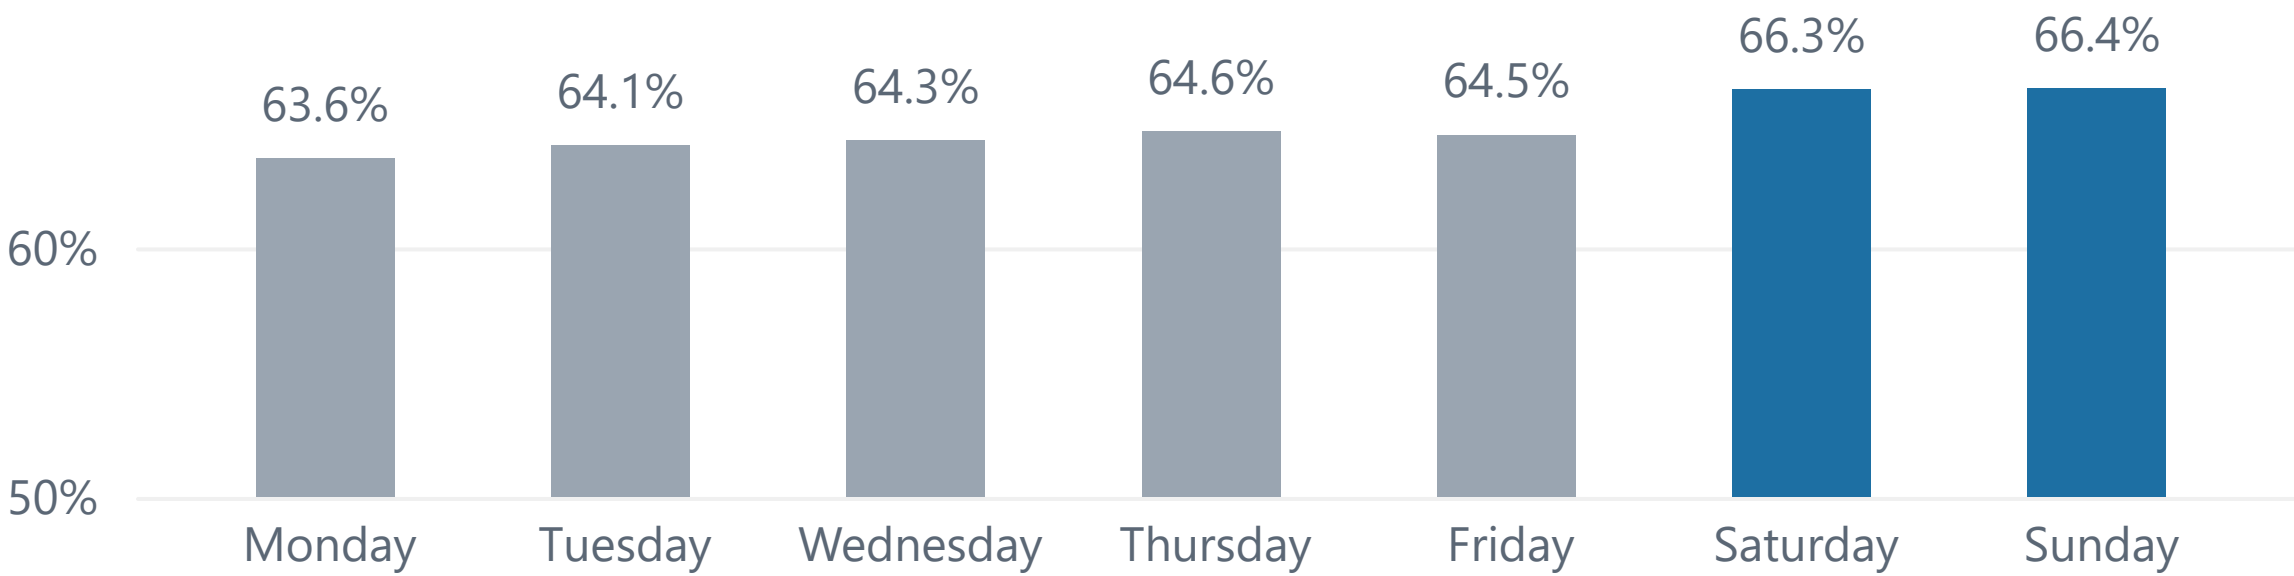

Tram

Bus

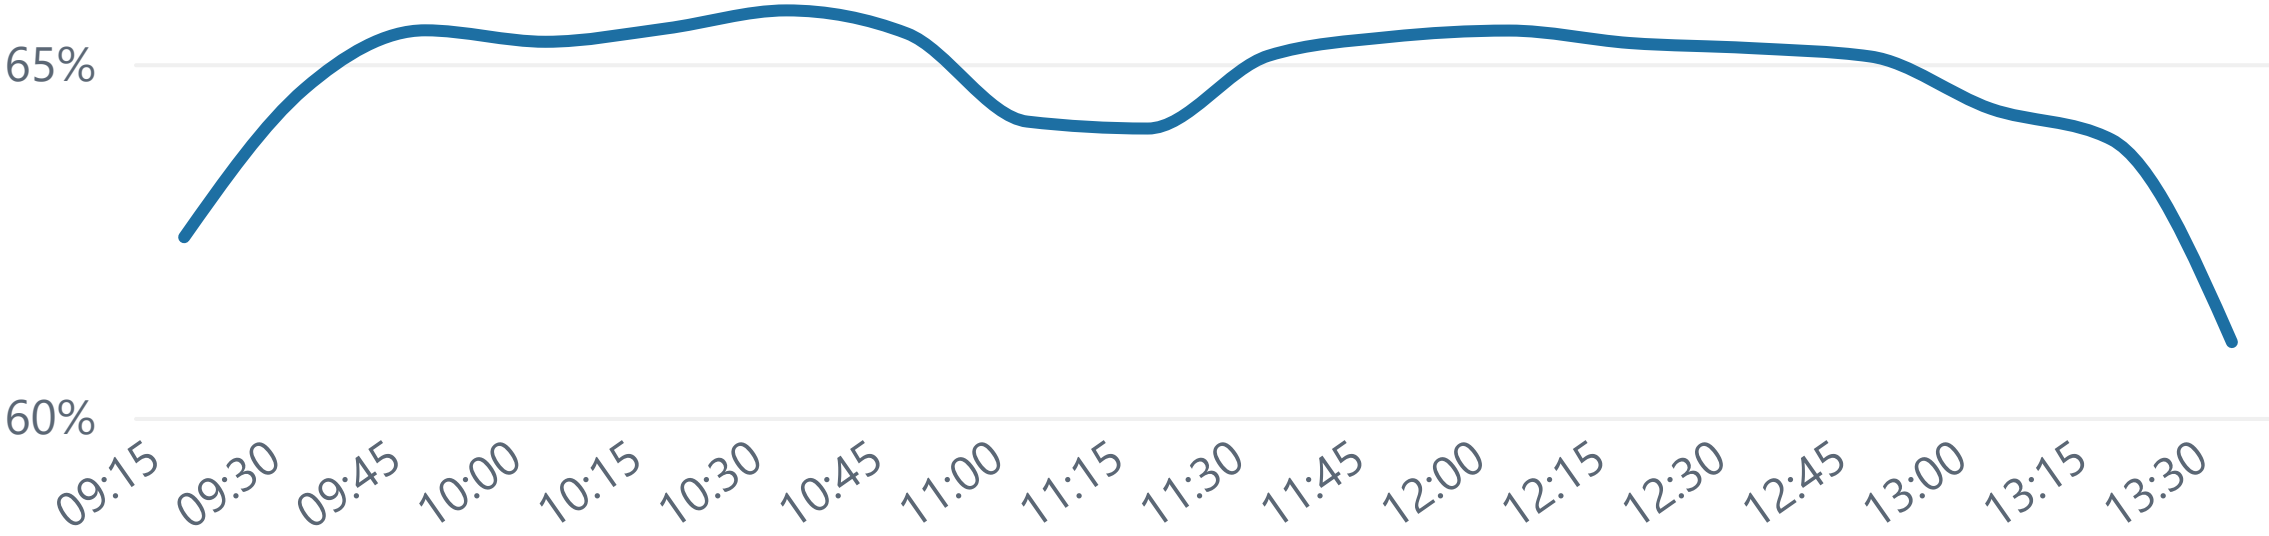

On-time rate by day and mode

Weekends are barely 2 points better

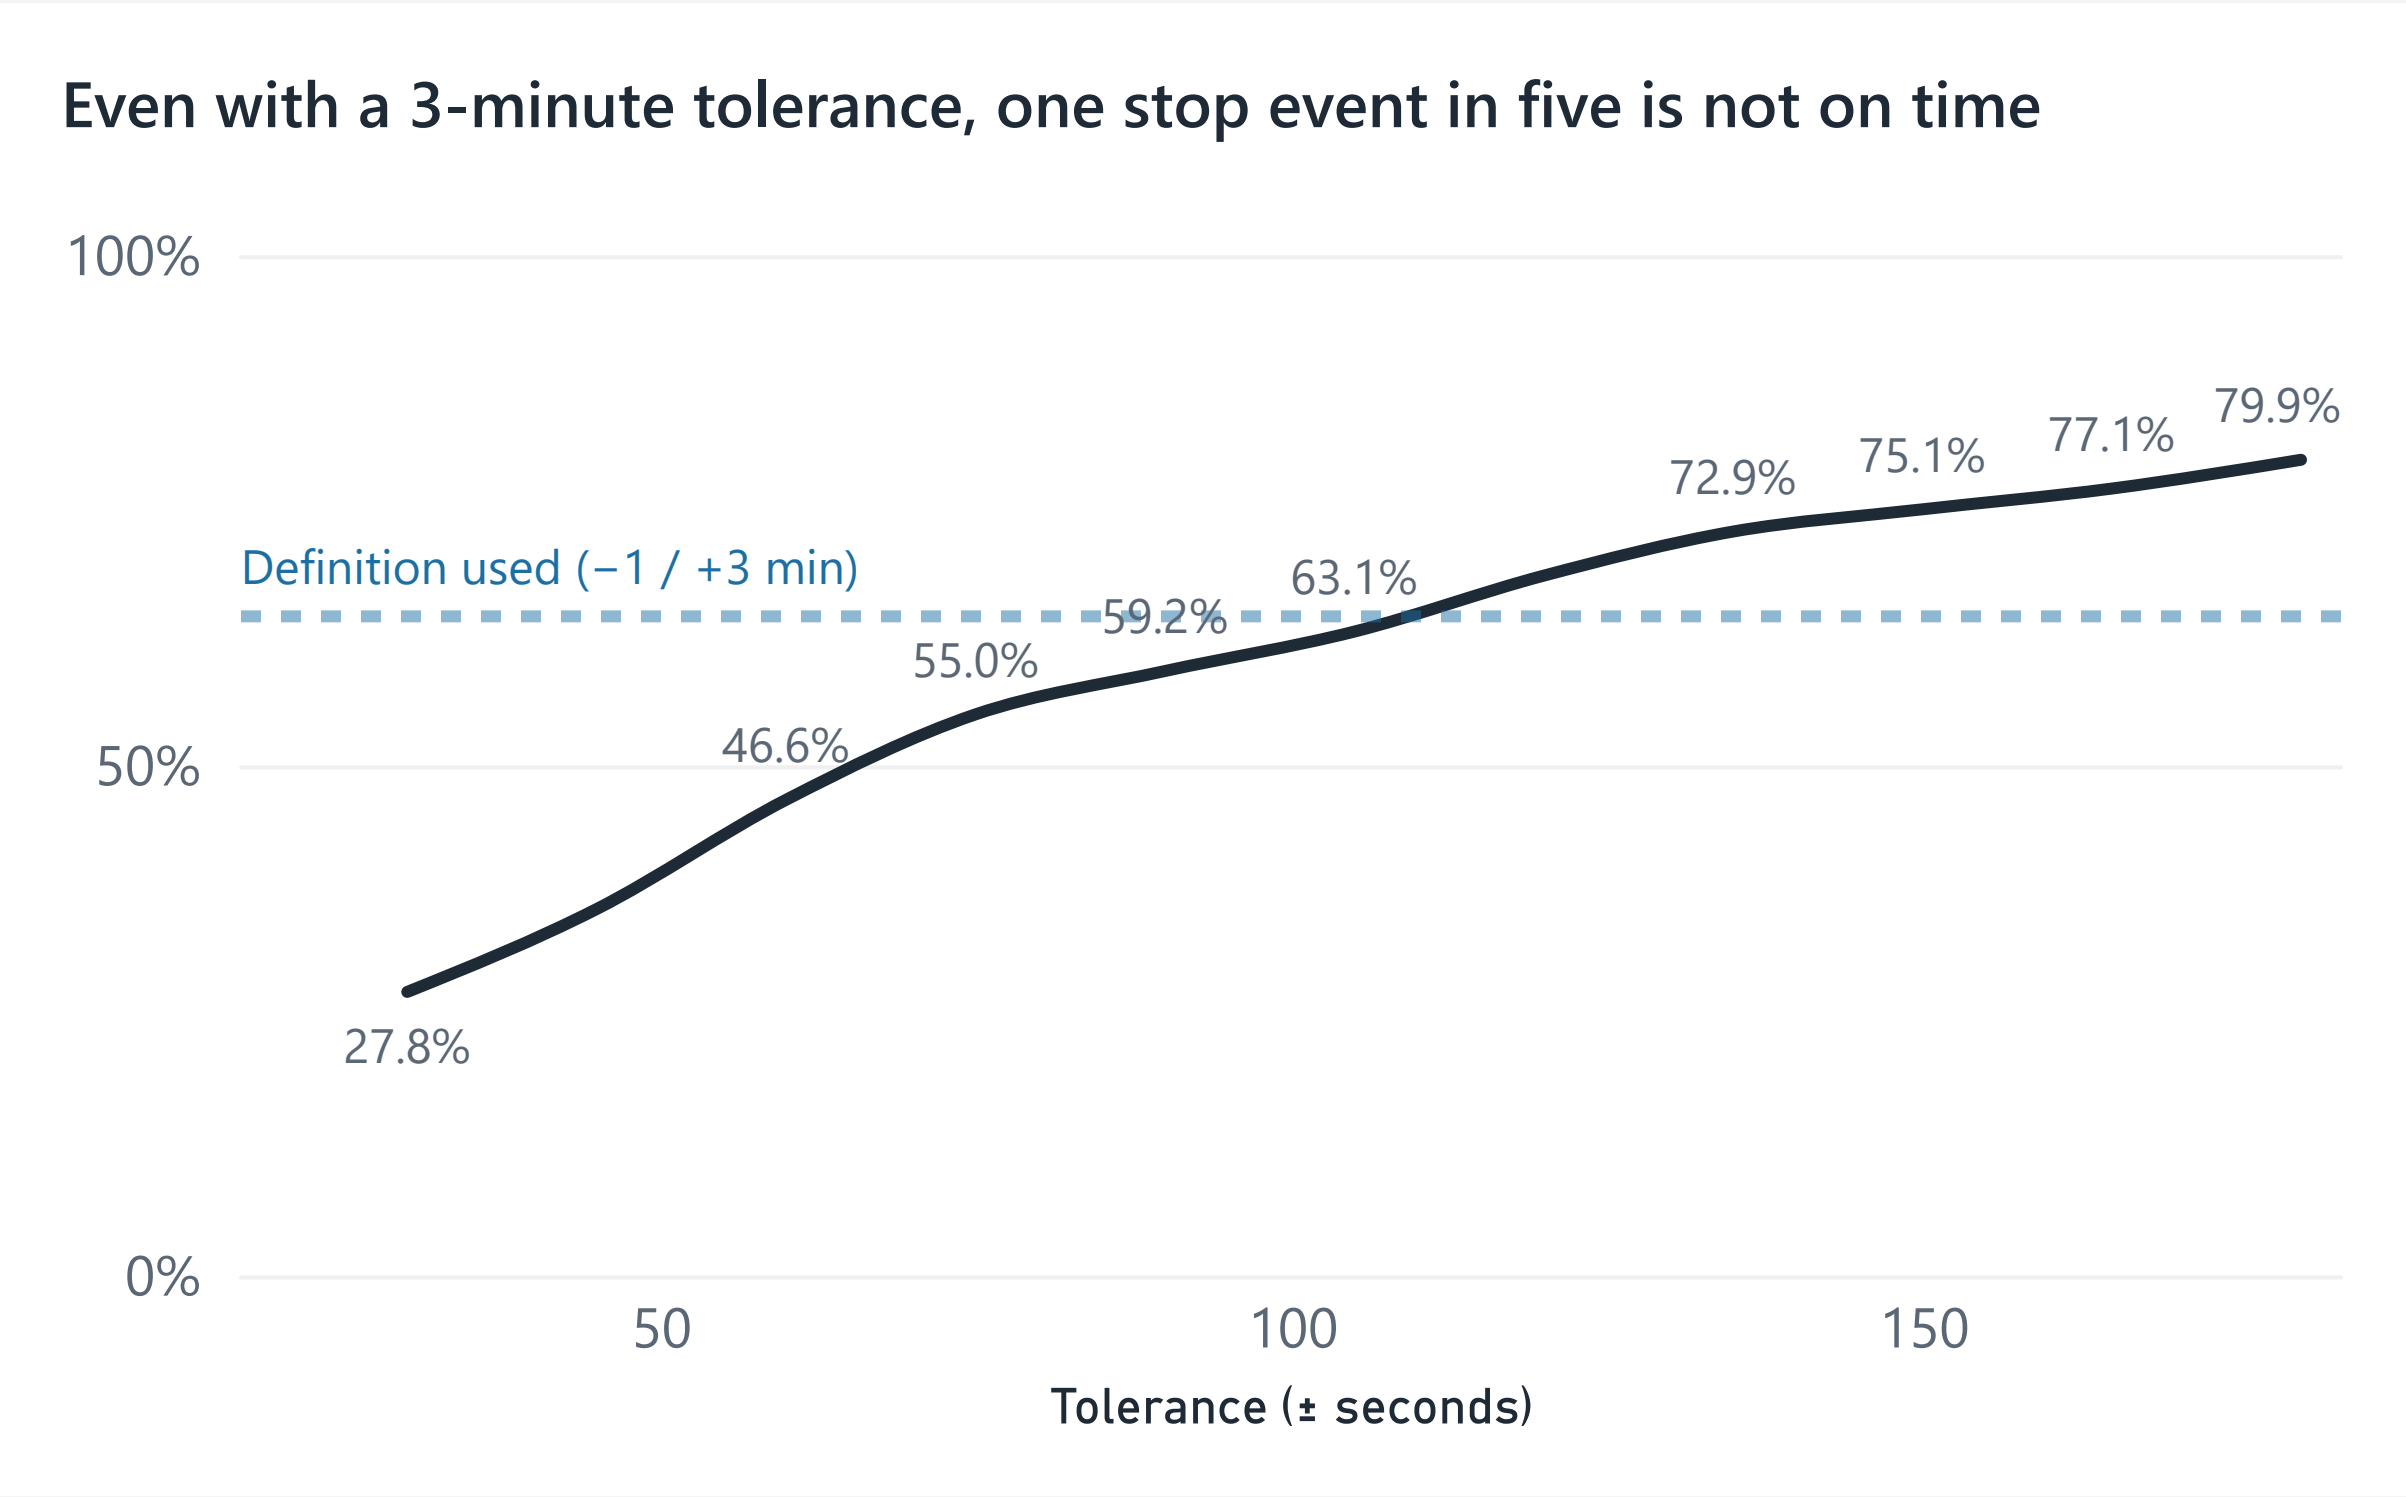

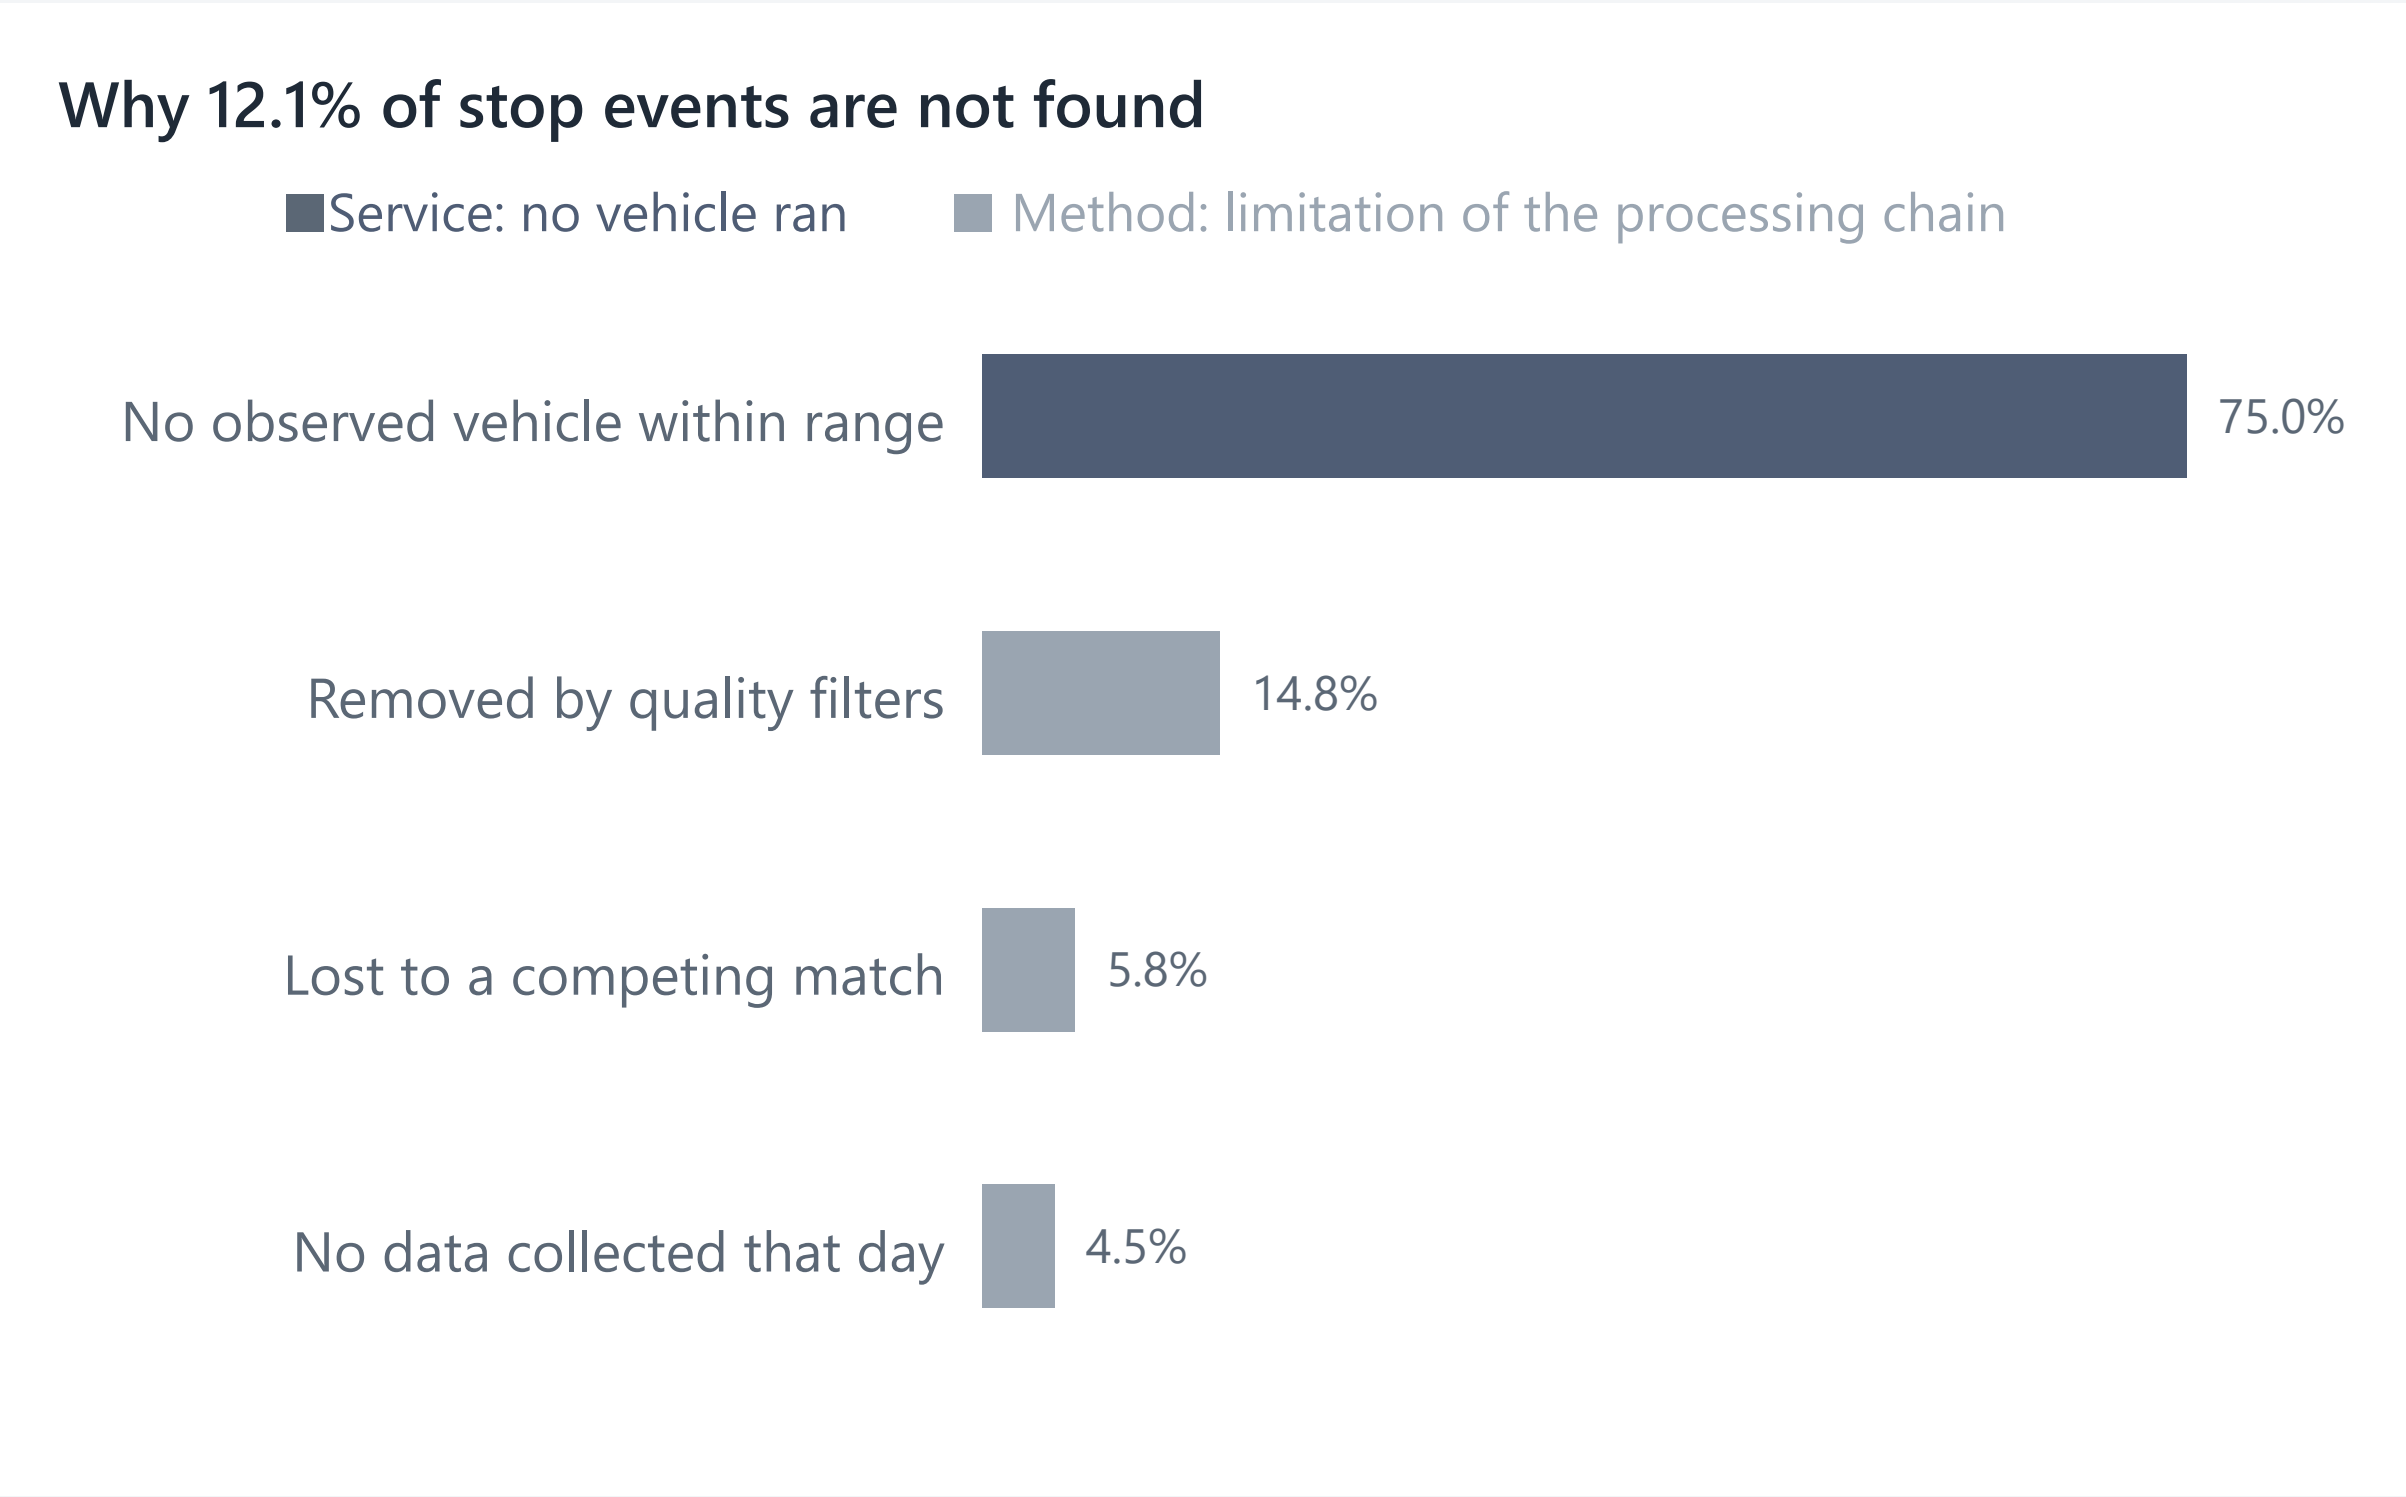

Time of day changes little, except at the edges of the window

Three quarters of the stop events not found are due to the service, not the method

How the indicator is built, what it measures, and what it does not.

33.5M real-time observations → **3.93M** reconstructed stop events, compared with **3.60M** scheduled ones, of which **3.43M** observable → **64.6%** on time

Limitations

With no trip identifier in the real-time data, a cancelled trip and a delay beyond tolerance cannot be told apart: both appear as "not found".
Arrivals at the final terminus are not published by the API: routes end at the last observed stop.
The measurement covers 9:15 to 13:45, from 1 July to 26 August 2026, including a period of roadworks: it represents neither peak hours nor the winter service.
